

Docket No. AUS920030479US1

CLAIMS:

What is claimed is:

1. A method in a data processing system for processing instructions, the method comprising:
 - responsive to receiving an instruction for execution in an instruction cache in a processor in the data processing system, determining whether an indicator is associated with the instruction; and
 - forcing an interrupt if the indicator is associated with the instruction.
2. The method of claim 1, wherein the forcing step comprises:
 - sending a signal from an instruction cache to an interrupt unit in the processor; and
 - processing the interrupt in the interrupt unit in response to receiving the signal at the interrupt unit.
3. The method of claim 2, wherein the processing step includes:
 - executing code associated with the interrupt.
4. The method of claim 3, wherein the code records cache misses by a functional unit attempting to access instructions in a cache.
5. The method of claim 1, wherein the indicator is located in a shadow memory.

Docket No. AUS920030479US1

6. The method of claim 1, wherein the instruction is received in a bundle and wherein the indicator comprises at least one spare bit in a field in the bundle.

7. The method of claim 1, wherein the indicator is located in a field in the instruction.

8. A method in a data processing system for processing data, the method comprising:

responsive to an access of data, determining whether an indicator is associated with the data; and

generating an interrupt if the data is associated with the indicator.

9. The method of claim 8, wherein the generating step comprises:

generating a signal by a data cache in which the data is located; and

receiving the signal generated by the data cache at an interrupt unit, wherein the signal indicates a presence of the interrupt to the interrupt unit.

10. The method of claim 8 further comprising:

processing the interrupt in an interrupt unit in response to generation of the interrupt.

11. The method of claim 10, wherein the processing step comprises:

executing a code for handling the interrupt.

Docket No. AUS920030479US1

12. The method of claim 8, wherein the indicator is associated with the data through a specific value in a memory location for the data.

13. The method of claim 8, wherein the data is located in a memory location.

14. A data processing system for processing instructions, the data processing system comprising:
determining means, responsive to receiving an instruction for execution in an instruction cache in a processor in the data processing system, for determining whether an indicator is associated with the instruction;
and

forcing means for forcing an interrupt if the indicator is associated with the instruction.

15. The data processing system of claim 14, wherein the forcing means comprises:

sending means for sending a signal from an instruction cache to an interrupt unit in the processor;
and

processing means for processing the interrupt in the interrupt unit in response to receiving the signal at the interrupt unit.

16. The data processing system of claim 15, wherein the processing means includes:

executing means for executing code associated with the interrupt.

Docket No. AUS920030479US1

17. The data processing system of claim 16, wherein the code records cache misses by a functional unit attempting to access instructions in a cache.

18. A data processing system for processing data, the data processing system comprising:

determining means, responsive to an access of data, for determining whether an indicator is associated with the data; and

generating means for generating an interrupt if the data is associated with the indicator.

19. The data processing system of claim 18, wherein the generating means comprises:

generating means for generating a signal by a data cache in which the data is located; and

receiving means for receiving the signal generated by the data cache at an interrupt unit, wherein the signal indicates a presence of the interrupt to the interrupt unit.

20. The data processing system of claim 18 further comprising:

processing means for processing the interrupt in an interrupt unit in response to generation of the interrupt.

Docket No. AUS920030479US1

21. A computer program product in a computer readable medium for processing instructions, the computer program product comprising:

first instructions for responding to receiving an instruction for execution in an instruction cache in a processor in the data processing system, determining whether an indicator is associated with the instruction; and

second instructions for forcing an interrupt if the indicator is associated with the instruction.

22. The computer program product of claim 21, wherein the forcing step comprises:

third instructions for sending a signal from an instruction cache to an interrupt unit in the processor; and

fourth instructions for processing the interrupt in the interrupt unit in response to receiving the signal at the interrupt unit.

23. The computer program product of claim 22, wherein the fourth instructions includes:

sub-instructions for executing code associated with the interrupt.

24. A computer program product in a computer readable medium for processing data, the computer program product comprising:

Docket No. AUS920030479US1

first instructions for responding to an access of data, determining whether an indicator is associated with the data; and

second instructions for generating an interrupt if the data is associated with the indicator.

25. The computer program product of claim 24, wherein the second instructions comprises:

first sub-instructions for generating a signal by a data cache in which the data is located; and

second sub-instructions for receiving the signal generated by the data cache at an interrupt unit, wherein the signal indicates a presence of the interrupt to the interrupt unit.
